

Business Analyst tackles the challenge of change head on, by helping you document and analyze your processes.

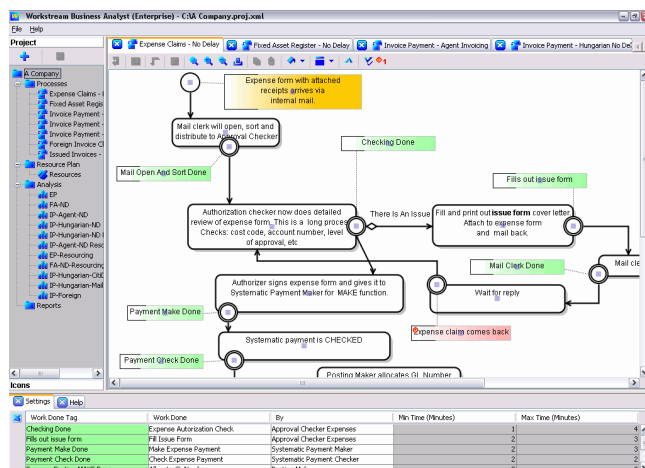

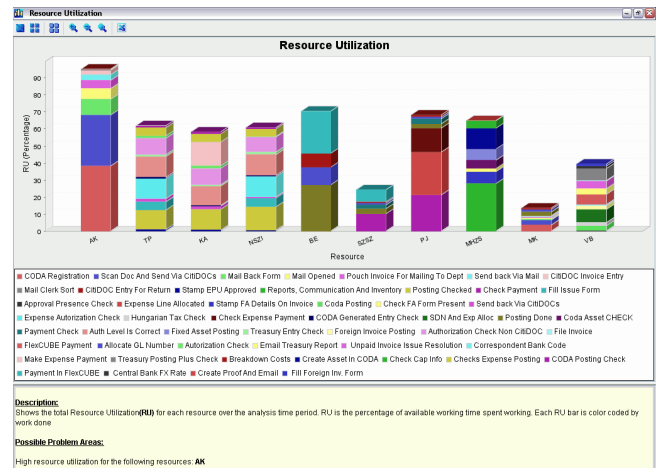

- Visually describe any business process
- Do "what if" scenarios before investing time and money
- Improve and understand resource utilization
- Improve customer satisfaction by designing streamlined business processes
- See the impact of moving or adding resources

Business Process Re-Engineering

Build 'as-is' and 'to-be' process diagrams and understand time-based quantitative impacts of change quickly. Predict resource requirements, capital equipment investments, process times, service levels and more!

Business Analyst allows you to rapidly document ANY business process in the industry standard **BPMN** (Business Process Management Notation) flow chart format.

Unlike plain drawing tools, **Business Analyst** uses *simulation* to analyze one or more processes and give you a comprehensive view of how your processes will behave in reality. The analysis includes sixteen different charts showing cost, work done, delays, resource utilization and more. You can therefore quickly identify breaks, bottlenecks, uneven work distribution and high costs at each stage of multiple processes.

A 'report assembly' mode, allows you select diagrams and analysis charts, combine them with a title page and company log, and generate a comprehensive process engineering report in Adobe PDF format.
